

AMENDMENTS TO THE CLAIMS

This listing of claims replaces all prior versions and listings of claims in the application.

Listing of Claims:

1. (Currently Amended) A light emitting device, comprising:

~~a light emitting element having an electric signal terminal, that is driven the light emitting element being configured to emit light by an electric signal given from outside to output from the electric signal terminal; and~~

~~a semiconductor chip for driving the light emitting element, including having a light emitting element driving circuit and a temperature detecting element that are made of a semiconductor, the semiconductor chip being configured to drive the light emitting element, the light emitting element driving circuit outputting and applying transmitting the electric signal to the electric signal terminal of the light emitting element, the temperature detecting element detecting a ambient temperature surrounding the light emitting element,~~

wherein the light emitting element is mounted on the semiconductor chip for driving the light emitting element, and is driven based on the temperature detected by the temperature detecting element.

2. (Currently Amended) The light emitting device according to claim 1, wherein at least part of the temperature detecting element is disposed in a light emitting element disposed region, ~~the light emitting element disposed region being that is a minimum region including where the light emitting~~

element projected is being mounted on the semiconductor chip for driving the lighting emitting element.

3. (Currently Amended) The light emitting device according to claim 1, wherein the light emitting element driving circuit is formed in the semiconductor chip for driving the light emitting element excluding [[the]] a light emitting element disposed region.

4. (Currently Amended) The light emitting device according to claim 1, wherein the light emitting element [[is]] comprises a plurality of visible light emitting elements that emit light at different wavelengths, and the semiconductor chip for driving the light emitting element drives the light emitting elements individually to maintain a white balance of the plurality of light emitting elements based on the temperature detected by the temperature detecting element.

5. (Currently Amended) A lighting equipment, comprising:

a plurality of the light emitting devices according to claim 1.

6. (Currently Amended) A semiconductor chip for driving a light emitting element, on which the light emitting element can be being mounted on the semiconductor chip, the light emitting element and having an electric signal terminal and driven configured to emit light by an electric signal given to output from the electric signal terminal from outside, the semiconductor chip comprising:

a light emitting element driving circuit that outputs and applies transmits the electric signal to the electric signal terminal of the light emitting element; and

a temperature detecting element that detects ~~an ambient~~ a temperature surrounding the light emitting element,

wherein the ~~semiconductor chip drives~~ the light emitting element is driven based on the temperature detected by the temperature detecting element.

7. (Original) The semiconductor chip for driving a light emitting element according to claim 6, wherein at least part of the temperature detecting element is disposed in a light emitting element disposed region which is a minimum region including the light emitting element projected on the semiconductor chip for driving the light emitting element.

8. (Original) The semiconductor chip for driving a light emitting element according to claim 6, wherein the light emitting element driving circuit is formed in the semiconductor chip for driving the light emitting element excluding the light emitting element disposed region.

9. (Currently Amended) The semiconductor chip for driving a light emitting element according to claim 6, wherein the light emitting element ~~[[is]]~~ comprises a plurality of visible light emitting elements that emit light at different wavelengths, and the semiconductor chip for driving the light emitting elements drives the light emitting elements individually to maintain white balance of the plurality of light emitting elements based on the temperature detected by the temperature detecting element.

10. (New) The light emitting device according to claim 1, wherein the semiconductor chip ceases to drive or deactivate the light emitting element at a predetermined temperature.

11. (New) The light emitting device according to claim 1, wherein the temperature detecting device is not physically connected to the light emitting device.
12. (New) The light emitting device according to claim 1, wherein the temperature detecting element detects the temperature of the light emitting element.
